Abstract (en)
[origin: EP0513436A1] The invention concerns a recyclable waste collection container, essentially comprising a vertical wall (2) which closes off the inside of the container from the side, at least one waste-receiving opening (5) in the upper region of the wall, one container lid (3) with a carrying ring (24), at least one base plate (32) which is fastened in an openable manner in the lower region of the wall and is articulately connected to the wall by means of at least one hinge, and a locking and opening device (6) which is arranged primarily in the inside of the container, is articulately connected to the base plate and can be actuated from outside the collection container. To this end, it is proposed that the collection container should have a rectangular outline and should be enclosed by four rectangular side walls, of which at least one has at least one waste-receiving opening (5) in which an opening frame (8) can be inserted and can be connected to the side wall, the opening frame having an opening corresponding to a predetermined type of waste and the side walls, the base plate and the container lid being made of sheet steel. <IMAGE>
