Abstract (en)

A silver halide color photographic light-sensitive material which is lowered reciprocity failure and increased in speed. The light-sensitive material comprises a support and a silver halide emulsion layer provided on the support. The emulsion layer contains silver halide grains which are formed in the presence of a metal complex having an oxidation potential of from -1.34 V to +1.66 V and a reduction potential of lower than -1.34 V and are chemically sensitized in the presence of a gold-containing compound.
