Abstract (en)  
The invention relates to a container for applying a product, comprising an outer sheath (2) and a support (18) for the product, mounted slidably and connected to an outer actuating button (20) intended to cause the said support to slide in the same direction as that of the said button, in order to cause the product to emerge or, respectively, to retract into the sheath through an opening (7) with which it is equipped and which can be closed by a closing screen (14) connected to the said button and to the said support. <?>The device according to the invention is noteworthy in that it comprises a guide sleeve (3) mounted in the sheath (2) and in which the support (18) of the product slides, whilst, on the outside, it forms a guide for the closing screen consisting of a flexible small plate (14) connected to the support via two lateral tabs (15d) which, between them, provide a free space (16) forming a passage for the product while at the same time permitting release of the opening (7) of the sheath when the small plate retracts by sliding. <IMAGE>
