Abstract (en)

Product for desulphurisation of pig iron, consisting essentially of a mixture of calcium carbide and magnesium particles. The magnesium particles are coated with a layer of inorganic product to which a binder is added. The inorganic product coating the magnesium is also preferably calcium carbide. The diameters of the magnesium and calcium carbide particles are chosen so that they are proportional to the mean densities of the coated magnesium particles and of the calcium carbide particles. The calcium carbide particles themselves may consist of finer particles agglomerated by a binder. The binder is preferably a fatty ester, of sharp and relatively high melting point. The desulphurising mixture according to the invention is injected with the lance into the pig iron baths. It has the advantage of being less reactive towards moisture and of not segregating during transport and storage.
