Abstract (en)

[origin: EP0514340A1] The blanks or labels (1) are taken one after the other from a storage part (20) by transfer means (21) and are arranged on the cylindrical bearing surface of a drum (3) driven in rotation according to turn portions. It is during the rotational movement of the drum or during the stops between two rotational movements that different preparation operations are performed on the blanks, such as, for example, the folding of a tab (16) and the adhesive bonding of this tab against a surface portion (15) of the blank or, alternatively, the printing of a code (17) on a part of the blank. Before these operations are carried out, the correct presence, positioning and alignment of the blank on the drum are checked. When the above operations have been effected, the blank is removed from the drum in order to be conveyed towards the packing machine. <IMAGE>
