Abstract (en)
[origin: EP0514751A1] In a shower for shower devices and bath devices, having a water feed channel (3) and a shower head (1) which is arranged on the water feed channel (3) and has a plurality of jet nozzles (11) which produce shower jets and can be optionally connected to the water feed channel (3) by turning the shower head (1) about its longitudinal axis, for the sake of improvement and so as to improve a reliable mode of operation with the same smooth running over a long time period it is proposed that a sealing disc (4) with at least one through-opening (40) be arranged fixed in terms of rotation but axially displaceably between the water feed channel (3) and the shower head (1), an elastic ring (41) being provided at the edge of the region of the sealing disc (4), with which ring (41) the edge seal to the water feed channel is brought about and the sealing disc (4) is pressed in a resilient manner with a minimum contact force against the shower head (1). <IMAGE>
