Abstract (en)  
[origin: EP0514880A1] Overhead door (1) having a door leaf (2) which is guided by means of rollers (4) in guide rails (3) arranged approximately parallel to the frame side regions, in the lower side-edge region (5) of the door leaf (2) and via links (6) which are pivotably connected (7) at one end to the two side regions of the latter and which are held at their other ends (11) in the respective associated upper frame side region (18) in an articulated manner, which overhead door is designed, for the purpose of quiet movement of the door leaf free of shaking movements, in such a way that additional guide rails (17) are provided so as to extend horizontally from the upper frame side regions (18) into the interior of the space to be closed off by the door leaf (2), into which additional guide rails (17) engage respectively in the upper side edge region (19) of the door leaf (2) rollers (21) which are each held pivotably via a pivoting lever (22) about an approximately horizontal axis (23) extending perpendicularly to the direction of guidance of the guide rails (3, 17). <IMAGE>
