Abstract (en)
[origin: EP0450328A2] The invention relates to a method for feeding labels (2), provided on at least one side with visible print, to a device providing objects (92) with the labels, and is characterised in that the labels (2) stick by adhesion in at least one row to a backing strip (4) wound up to form a roll, and in that the backing strip wound off the roll next to the device is drawn around a deflection edge (94) for the successive detachment of the labels from the backing strip. <IMAGE>
[origin: EP0450328A2] The plate cylinder has an inner print carrier provided either side with a laminated foil or varnish. The print carriers (2) stick in at least one row through adhesion on a carrier belt (4) which is wound up into a roll. The carrier belt is unwound from the roll and then drawn from the device round a deflection edge to release the print carriers from the carrier belt. The print carriers can have holes (6) for fitting on bottle necks. The carrier belt can have an adhesive layer on which the adhesive layer covering the print carrier can detachably stick. @ (6pp Dwg.No.5/6)@.
