Abstract (en)

[origin: EP0516584A1] The cargo carrier (1), for example an interchangeable container, is secured on the turntable (2) of a railway wagon by means of swivellable holding claws (11, 11') which are articulated below the turntable. The holding claws are permanently acted on by an energy store, preferably in the form of a spring 14, and are pressed into the engagement position. This engagement position is reached as soon as the two parallel support rails (4, 4') of the turntable (2) are in the travel position parallel to the longitudinal sides of the railway wagon. <IMAGE>
