Abstract (en)

[origin: EP0516586A1] The device has a bolt 11 or 11' which is held by gravity in the closed position. After the bolt 11 has been moved into the open position, it can be moved over by the two supporting rails 4, 4' of the turning platform 2 when turning outwards and when turning back inwards. When the travel position is reached again, the bolt 11' moves back automatically into the closed position again. An opening lever 18' which drops back into its initial position again when the turning platform 2 is turning outwards serves to move the bolt 11' into the open position. <IMAGE>
