Abstract (en)

[origin: WO9113281A1] A valve (13) for a dispenser (1) has a spherical valve body (17) which is fixed in the closed position by a spring catch (20). When a predetermined dispensing pressure is applied, the valve body (17) is moved out of the locked position and displaced, like a piston, into a sealed receiving chamber (19), in which it is fixed. This results in a very simple, reliable closure of the outlet channel (12), which only needs to be opened once.
