Abstract (en)
[origin: EP0516974A2] 1.2. The invention relates to a reflector shade fitting having a hood-shaped, opaque upper housing part and a lower housing part which can be covered by the latter at least partially and forms a transparent fitting body. 2.1. The light emission of such a fitting is to be improved both downwards and to the side. 2.2. This is achieved when the upper housing part has a dome with an approximately spherical part and a cylindrical part, which adjoins the latter below and merges, forming an upper vertical step extending radially upwards, into a shade part which approximately has the shape of a conical frustum and is subdivided into two vertical sections in the region of its lower opening by a lower vertical step, and the fitting body projects in the form of a configuration in the form of a shell or an at least partial hemisphere at least partially from the lower vertical step or the lower opening of the shade part, and is fastened detachably to the upper housing part by means of a retaining device. <IMAGE>
