Abstract (en)
[origin: EP0517123A1] The connector comprises two elements (1) and (12) which can be mutually connected by means of pins (4) connected to a printed-circuit board carried by a rack (2). The locking of the two elements (1) and (12) in the connection position is achieved by means of a metal part (6) which surrounds the first element (1) and which is fitted with hook-shaped members (9) interacting with notches (10) made in a band (11), constructed from an electrically conducting material, surrounding the second element (12). The metal part (6), facing the pins (4), extends over their entire length. Spring elastic contacts (13) ensure the galvanic connection between the metal part (6) and a shielding track forming part of the printed circuit. The shielding device according to the invention makes it possible to ensure the protection of the pins (4) against electromagnetic interference.
