Abstract (en)

[origin: EP0518398A1] The device comprises two small plates (2 and 3) intended to be fastened to the inner wall of the back of a binding (1) for fascicles, each small plate being provided with a certain number of strips (6) fastened with the aid of rods (7) to the small plate (2); these strips may be detached by the user in order to be introduced into perforations made in the thickest part of the small plate (2) in question and then to be immobilised by means of rotation of a stop (10) which hangs on the element (8), enabling the user to determine the number and the spacing of strips to be inserted into the said small plate, as a function of the number and of the dimensions of the fascicles to be combined. <IMAGE>
