Abstract (en)

The invention relates to a cap (22) of the type comprising a lid (24) and a cap body (26) equipped with at least one safety valve (36) and which is locked on a portion (18) of the neck (10) by means of catching lugs (34). According to the invention, the annular portion of the inner face (28) of the lid (24) of the cap (22), which interacts with the end face (16) of the neck (10) comprises gradients (52) which enable the lid (24) to be moved away progressively from the end face (16) when the cap (22) is open, in order to avoid discharges of gas and/or of liquid under pressure. <IMAGE>
