Abstract (en)

[origin: EP0519302A1] In a device for clamping printing blankets to transfer or offset cylinders of rotary printing machines, in particular for the separate clamping of the lowest layer or layers of multi-layered dressings, a clamping strip is used which can be pressed on as a result of the operative connection to an edge of the radially extending slot of the clamping shaft. The advantage of the device according to the invention lies in particular in the fact that a self-acting and reliable clamping of the backing sheet takes place when the printing blanket or rubber blanket is clamped without requiring an additional operation or the use of tools. <IMAGE>
