Abstract (en)
[origin: EP0519566A1] The invention relates to a device for continuous metering and delivering into packaging units (10) of products ready for use, such as screws, nuts, bolts etc. The device comprises a stock container (V), a conveyor system comprising at least two trough conveyors (3, 4) provided with vibrating elements, means (M) for regulating the speed of conveyance of the products to be metered, and means (11, 12) for weighing and metering the products. Connected to at least one trough conveyor (3, 4), the device is provided with a buffer element which is preferably an endless belt (9). The buffer action of an endless belt (9) takes place through reversal of its direction of conveyance. The use of such a buffer element makes it possible to limit considerably the falling height of the products for metering, and thus to reduce the risk of damage, while the supply of products from the stock container (V) need not be interrupted at any stage at all. <IMAGE>
