Abstract (en)

The apparatus (5) is composed substantially of a number of modular elements (1, 2) of curvilinear extension, in particular of arcuate extension, with their end cross-sections lying in planes forming an acute contained angle. The adjacent elements (1, 2) are connected together so that they cannot move relatively in the longitudinal direction, but are free to rotate relative to each other about the central axis of that end cross-section in correspondence with which they are connected together. The end element of the plurality of elements carries one or more lighting lamps. The ability of the elements to be rotated relative to each other and their curved shape enables the apparatus configuration to be varied and the light beam to be orientated in any direction. <IMAGE>
