Abstract (en)  
[origin: WO9113687A1] An applicator head (1) is to be connected to a double pump for air and liquid, which are pumped separately first through flow smoothing devices (30) and then in a common duct (28) so that the air passes in numerous individual jets at low pressure and low flow rate into a sieve unit which is wetted with the liquid and is located in an expanded chamber (32). In the region of the sieve, which is supplied with the liquid from a chamber (23), the liquid can be foamed by degrees with the aid of air until the foam to be applied issues from an end channel (33).
