Abstract (en)

[origin: EP0520254A1] So that, with a guiding device consisting of a guide ring (1), faults in the circulation of a textile strand (2) can be eliminated with care, the guide ring (1) fastened to a pivot axle (5) is equipped with a carrier (6) on its side located opposite the pivot axle (5). In the event of a pivoting movement of the guide ring (1) limited to approximately 270 DEG , the carrier (6) is also pivoted correspondingly, the textile strand (2) looping increasingly round the carrier (6). This thereby exerts, during the pivoting movement, a tensile force restricted essentially to the direction of circulation of the strand (2), so that said tensile force extends to the region which is the cause of the circulation fault. <IMAGE>
