Abstract (en)  
[origin: EP0520269A1] It is known to set up installation units having at least one sanitary fitting by means of height-adjustable foot supports on an uncovered floor. These installation units are clad on their front side by at least one covering element, the lower horizontal edge of which maintains a distance from the uncovered floor, so that outwardly there is a gap from a cavity behind the covering element. In order that, for example when placing the screed on the uncovered floor, the screed cannot flow undesirably through the gap into the cavity behind the covering element mentioned, to close off this gap (22) according to the invention an angled-off partitioning element (23) is fastened height-adjustably to the supporting frame (12) of the installation unit (10), preferably behind the covering element (20). The horizontal section (25) of the partitioning element (23) overlaps the projecting parts of the footplates (17), in order to avoid any damage to the welded or foil sheetings, used for dampproofing, by the sharp edges and borders of the footplates (17). <IMAGE>
