Abstract (en)
[origin: EP0520362A1] The invention relates to a key-ring, having a discus-type body (1) and an undercut groove (2) which passes around its narrow side and in which at least one anchoring element (3) can be hooked which bears a ring for keys. In order to be able to handle the key-ring conveniently and to be able to design it in a visually attractive manner, provision is made for the discus-type body (1) to be subdivided about a plane (18), arranged perpendicular to the plane of the peripheral groove (2), into two partial bodies (4, 5) which are connected to one another for rotation about an axis of rotation (6) arranged perpendicular to the plane (18). <IMAGE>
