Abstract (en)

[origin: EP0520411A1] The invention relates to a wrap-around sleeve for a group of objects, such as primary containers, which starts from a blank and comprises a top wall (106), two side walls (102, 104) and two bottom wall halves (108a, 108b). Each bottom wall half has on each longitudinal outer edge a closure flap (136a, 136b, 138a, 138b) which is linked to it, a bellows transition (144, 146) being provided between each closure cap and the adjacent side wall and serving for aligning the said closure flap in a sloping position which is fixed in relation to the bottom wall half when the blank is folded together in a three-dimensional manner. A closure flap (136a, 138a), which is provided on one (108a) of the bottom wall halves, is considerably shorter than the closure flap (136b, 138b) which is provided on the other bottom flap in order to form a zone in which the two closure flaps overlap one another, the closure flap (136a, 138a) coming to rest outside the closure flap (136b, 138b) in this zone in order to stabilise the latter closure flap and to define a continuous gable shape at the base of each opening of the longitudinal edge. <IMAGE>
