Abstract (en)

Casing for electrical apparatus, in particular for a circuit breaker or a circuit auxiliary, consisting of two half-castings (12, 14) matched so as to come up against one another in order to assemble together to define an internal compartment. According to the invention, one of the half-castings (14) includes at least one male piece (34) of truncated conical shape and the other half-casting (12) includes at least one female piece (32) of conjugate shape. When the two half-castings are assembled according to a first position of assemblage, each male piece (34) engages in a female piece (32) thereby constituting a removable interlock and, when the two half-castings are assembled according to a second position, each male piece (34) engages further into the female piece (32) thereby constituting a non-removable interlock. <IMAGE>
