Abstract (en)

A collapsible gate with a built-in antitheft means comprises a plurality of uprights which, at the ends thereof, are engaged with a guide top rail and a guide bottom rail, the uprights being movably connected by means of scissors crossed rods. The main feature of the invention is that each of the uprights is formed by a pair of C-shape section members, opposite to one another and coupled by means of connecting pins welded, at the end portions thereof, to the inner surface of the central wall of the C-shape section members, at least a portion of the pins forming an articulation fulcrum or pivot center for the rods. <IMAGE>
