Abstract (en)

[origin: EP0520963A1] A mounting device for a normally solid wood panel adapted to cover the front door of an embedded household appliance, in particular a dishwashing machine, when opening said bottom edge pivoted door, causes a sliding and simultaneous parting motion of said panel relative to the door. This is obtained through known rolling supports or sliding guides, in the upper portion of the panel where it contacts the door, and through an engagement between stationary hooks and lever or link members in the lower portion thereof, adapted to make said panel to part from said door, due to gravity, when opening said door. <IMAGE>
