Abstract (en)

[origin: EP0521282A1] According to the invention, such a boot (1) comprises an immobilising device (35) of the upper quarter (2) in an anteroposterior direction acting on an oscillating lever (11) capable of bearing on a stop (13) of the shell bottom (5). These means consist of a rotating member (10) with external control (18), an inner part (19) of which actuates, by means of a cam (19a), a feeler member (11b) belonging to the oscillating lever (11) in order to impart to the latter an angular deflection around its spindle (12) towards a locking or unlocking position relative to the stop (13) obtained on the shell bottom (5). <IMAGE>
