Abstract (en)  
[origin: EP0521803A1] Device (1) making it possible to connect two electric conductors (2, 3), at least one (2) of which is in the form of a rigid bar, it being possible for the other (3) to be both a rigid bar and a flexible supply element composed of stacked sheets (strips), including two chambers or grooves (5, 6) each intended to receive one of the elements (2, 3) to be connected, and means (7) for locking the said elements inside the chambers, characterised in that the locking means (7) are constituted by terminals or bushes (8) screwed inside a wall (9) defining each chamber or groove (5, 6), which bushes bear against the surface of each element (2, 3) to be connected and which include means making it possible to control the locking pressure and to prevent continuation of tightening when a predetermined limiting value is reached. <IMAGE>
