Abstract (en)

[origin: WO9213127A1] A control device for the shifting movement of a guide bar (4) comprises a pick-off gear (10) against which the guide bar is pretensioned. The pick-off gear (10) has a plurality of thrust components (8, 81?, 82?, 83?) one behind the other, between which are arranged displacement components (121?, 122?, 123?, 124?), on the control curves (34) of which the thrust components (8, 81?, 82?, 83?) are supported. The displacement components (121?, 122?, 123?, 124?) are connected via coupling devices (16) to a Patton controlled adjusting device (18) and can be shifted between a basic and a switched position. In order to improve the warp knitting machine, the adjusting device (18) takes the form of a negative dobby or Jacquard machine operating on the double-stroke system and the displacement components are pretensioned in one position.
