Abstract (en)

[origin: EP0522928A1] Method for packaging a palettised load by means of plastic film, in which an initial end part of a film strip, coming from a reel, is associated with the lateral side of the load; a pivoting movement of the shaft of the reel of film and of the load around a first axis is effected and the film strip is deposited on this lateral side; the film is deposited on the upper end side to be covered; the film strip is cut transversely and is joined to the film deposited or to the load; a pass is performed in which the pivoting movement is halted; a relative pivoting movement of one quarter to three quarters of a revolution of the shaft of the reel and of the load about a second axis is effected; in this situation, at least one sliding movement of the shaft of the reel and of the load along the second axis is effected; then a pivoting movement of one quarter to three quarters of a revolution of the shaft of the reel and of the load about the second axis is effected; and the pivoting movement about the first axis is recommenced. <IMAGE>
