Abstract (en)

[origin: EP0523713A1] The invention relates to a knife, especially a kitchen knife, consisting of the knife blade (1) with handle extension (2) on which the knife handle (3) is arranged. According to the invention, the knife is designed in such a way that the knife handle (3) is formed from a hollow metal body (4) with at least one aperture (5) in each flank of the handle and that plastic (7) which encloses the handle extension (3) and which projects from the apertures (5) over the handle flank surfaces (6), to form handle knobs (7') is arranged in the hollow space and in the apertures (5). A knife of the conventional type has therefore been improved by making the knife handle consist essentially of metal while at the same time enabling it to be gripped securely (and also to be protected against slipping when it is temporarily set down during work), this being combined with a manufacturing method which is as simple as possible and reliable connection of the components to be processed, with no connection elements being visible on the outside. <IMAGE>
