Abstract (en)

The apparatus includes a pressing container (2), into which the product to be separated is fed, and constituted by a pressing chamber (15) which is delimited by a flexible diaphragm (9) and by a discharge device (19). The flexible diaphragm is adjacent to a region (17) which is substantially at atmospheric pressure: the pressing chamber is connected to a vacuum device (27) adapted to generate a negative pressure, so that the diaphragm acts on the product and presses it. <IMAGE>
