Abstract (en)
[origin: EP0525711A2] A device (10) for burning bio-masses and/or solid materials has a combustion chamber (16), a hearth (26) and, downstream of the combustion chamber (16), a space (48) with heat-exchanger surfaces (50). A contraction (40) is also present between the combustion chamber (16) and this downstream space (48). This device (10) is characterised in that the contraction (40) is part of a duct, one mouth region (42) of which projects freely into the combustion chamber (16), and in that this mouth region (42) is at the same time directed into the interior of the gas or fire cylinder (22). <IMAGE>
