Abstract (en)

[origin: EP0526799A1] Device for connecting pane retainers to profiled elements, which comprises a pane retainer profile (1) which has, in transverse cross-section, an end wing (2) which can be coupled to a plate (3) and is provided with an accommodation seat (4) for a weather strip (5) which presses on the plate (3) and can be extracted in a direction which is substantially parallel to the plate. A terminal insertion portion (6) can be inserted in a recess provided on a profiled element (8) which defines a plate supporting frame, provided with a tooth for engaging in a hollow defined within the recess. A plurality of shims is provided with means (13) for coupling to the profiled element (8) and elastically deformable means (16) which are suitable to engage against a surface (12) of the pane retainer profile (1) which is parallel to the plate (3); the wing (2), the terminal portion (6) and the accommodation seat (4) extend along substantially mutually parallel directions. <IMAGE>
