Abstract (en)  
[origin: WO9115246A1] Methods for the treatment of undescended testicles in male animals are described which methods comprise administering to a subject in need of such treatment calcitonin gene-related peptide (CGRP) or an analogue thereof having CGRP activity, optionally in association with a carrier and/or excipient, in an amount effective to cause testicular descent. There is also described pharmaceutical compositions for the treatment of undescended testicles in male animals, which comprise CGRP or an analogue thereof having CGRP activity in association with a pharmaceutically acceptable carrier and/or excipient. The use of CGRP in the treatment of undescended testicles is an effective alternative to invasive surgery.
