Abstract (en)

[origin: EP0529446A1] In a device for fixing and tensioning a blanket on a cylinder of a printing machine, the rubber blanket is to be held while it is mounted, and a long end of the rubber blanket is then to be tensioned with little effort. <??>According to the invention, this is achieved in that there is a rack (27) which can be actuated by a straining screw (21) and is operatively connected via an intermediate gear wheel (11) to teeth on the circumference of the tensioning shaft (3), and in that a retaining device is provided for the beginning of the blanket, which retaining device can be actuated via the intermediate gear wheel by means of a cam disc (16) and a ram (41). <??>The device can be actuated with little effort. Due to the long tensioning path of the ends of the rubber blanket, the beginning of the blanket can be readjusted once or several times following wear phenomena and the like. <IMAGE>
