Abstract (en)  
[origin: EP0530466A1] In a gear shift device for a motor vehicle transmission, three gears can be preselected by turning a selector shaft (4) and the gears can be shifted by shift forks (11) by longitudinal displacement of the selector shaft. For the purpose of locking the gears which are not to be shifted, there is a blocking shaft (7) which lies parallel to the selector shaft and is rotatable by it. The blocking parts secured on the blocking shaft prevent a longitudinal movement of those shift forks which are assigned to the gears which are not to be shifted. <IMAGE>
