Abstract (en)
[origin: EP0530785A1] A dispensing device (1a) has at least one slide (7a) with running faces and/or contact faces (17a, 21a and 31a, 35a) which rest in a prestressed fashion in at least one working position, a device (20, 20%) with which the pressure stress acting on this surface can be varied as a function of the control path of the slide being provided for at least one of these faces. For example, piston lips (18a, 22a) can be relieved of stress in the position of rest in order to reduce the temperature-dependent dependency to deform or a valve closing stress can be increased or reduced. <IMAGE>
