Abstract (en)

A receptor contact is formed as a one-piece unit from a phosphor bronze sheet. The contact has confronting side sections (4, 6) which define a passage (8) for receiving a contact pin (18). A beam (10) extends downwardly from one of the side sheet section (4) and another contact beam (16) is bent back from the lower end of the other sheet section (6) in a manner to extend upwardly along the inner wall surface of the opposite side sheet section (4). The contact beam (16) and the side section (4) are deformed at substantially central regions to provide projections within the passage (8) to grip the pin (18) elastically. <IMAGE>
