Abstract (en)

[origin: EP0531626A1] What is provided is a fitting for positively tiltable and parallel-settable wings with wing rebate (10) of windows, doors or the like, in which the wing is held and guided so as to be both tiltable and settable in parallel by means of setting-out arms (8, 9). For positive actuation, an actuating linkage (16) arranged on the wing cooperates with the setting-out arms. For this purpose, an espagnolette element (17) of this linkage is held and guided in the region of the fitting on one side of a bearing plate (18) fixable to the casement, whilst the setting-out arm (8, 9) is mounted non-displaceably on the other side laterally next to the espagnolette element on the bearing plate (18). The setting-out arm has a portion (20) resting flat on the top side of the bearing plate and having a control curve (33, 34) which is open towards the wing rebate (10) and which consists essentially of two straight curve segments (33, 34) which form an angle well above 90 DEG and which cooperate with an actuating stud (25) or the like connected directly to the espagnolette element (17). The setting-out arm (8, 9) is guided out of the wing rebate, without the wing rebate (10) having to be provided with a recess or perforation for this purpose. <IMAGE>
