Abstract (en)

[origin: EP0532473A1] The blow-moulded, integral package has a neck (19) and a spout (21) with an annular space (15) arranged between them as drip catcher. The intermediate piece (13) which connects the neck (19) to the spout (21) is flexible. A bulging of the inner wall of the spout (21) serves as coupling section (39). Provided on the closure (29) is a conical peg (37) which can be inserted in the spout (21) when the contents of the package have virtually been used up. The closure (29) thus serves as a tool for pulling out the spout (21). When the spout (21) has been pulled out, the closure (29) can be tilted and thus disengaged again. With the spout (21) pulled out, the package can be completely emptied. <IMAGE>
