Abstract (en)

[origin: DE4110830C1] The invention concerns a device for filling prefabricated cigarette tubes, the device having a housing (1), a tobacco chamber (17), a trough-shaped tobacco holder (7), a compression bar (23), a stop (31) for one end of the plug of tobacco, a finger (14) on which one end of a cigarette tube can be placed and a sliding cover (11). The length of the plug of tobacco formed can be adjusted to fit different cigarette-tube tobacco-spaced lengths by altering the length of the tobacco chamber (17) and the length of the compression bar (23). The invention does this by virtue of the fact that the end stop (31) is adjustable in a direction parallel to the longitudinal axis of the tobacco holder (7) and that at least two sections (41, 42, 43) of the compression bar, each of different length and each capable of acting as an extension to a stationary part (30) of the bar, are mounted on a rotating component (40) whose axis of rotation (45) is parallel to the surface (44) of the compression bar.
