Abstract (en)

[origin: EP0532931A1] An air-jet loom has a device for the formation of a fabric lane, the warp yarns passing through a reed in a controlled manner and being omitted at the location of the fabric lane. <??>In order to avoid a mechanism of a feeder (12) displaceable in the direction of the longitudinal axis of the warp yarns, the reed is divided into a plurality of part reeds (1, 2) which are at a mutual distance from one another and which form between them a reed gap (8) at the location of the desired fabric lane, and a reed filling piece (9) is respectively fastened in the region of the reed gap (8) in such a way that, in the rear reed position, it is oriented in line with the part reeds (1, 2). <IMAGE>
