Abstract (en)  
A heat setting apparatus has one or more defined paths (channels 20) through a chamber (18) to which hot (or hot and moist) air is supplied, the air being directed through air inlets (24) onto the shoes to be treated. In order to accommodate high-legged boots, each path (20) has an opening at its top through which the boot legs may project as the boot passes along the path. In order to reduce heat loss and to prevent discomfort to the operator, each such opening is closed by two cooperating elongated brush members (30). If desired, such brush members may also be used to close the front entrance and rear exit to each such path within the chamber (18). <IMAGE>
