Abstract (en)

[origin: WO9120016A1] In the field of photography, an interfacing device (10) is connected to a receiver unit by a first arrangement and to a feeder unit by a second arrangement. A driving roller (42) draws the photographic strip (153) out of the feeder unit so that it forms a loop (53) which triggers a control system (56) controlling the rotation speed of the motor (41). The device can be used for feeding a photographic film printer.
