Abstract (en)  
[origin: WO9218257A1] The invention concerns a semolina-purifying machine (1) which enables the basic functions to be carried out, as in the prior art, with complete visual monitoring of operations, but with a product-discharge system which is closed off from the atmosphere. The ingress and egress of dust are thus completely prevented, both during normal operation and during sampling operations. This makes it possible to operate either a single purifying machine or a group of machines using recirculated air. Air can be aspirated in from above.
