Abstract (en)
[origin: EP0534050A2] The liftable lamellar blind has pull elements which run at the side next to the lamellae as well as, distributed across the width of the blind, turning elements with strands which engage on the longitudinal edges of the lamellae. An actuating member (3, 3') holds the lamellae in a work position on lowering of the blind and releases them when the blind has been lowered. The actuating member (3, 3') consists of two discs (3, 3'), preferably toothed wheels or chain wheels, which, with cutouts (8, 11) in congruent positions, make possible the coupling function of a release element (6). <IMAGE>
