Abstract (en)
[origin: WO9200232A1] The proposal is for a rubbish collection and transport system using dustcarts and preferably domestic dustbins with several chambers in both the dustbins and the dustcart for the separate collection of rubbish of different natures in which the arrangement of loading apertures in the dustcart is to be decoupled from the arrangement of the partitions to form the individual storage spaces in the dustcart. To this end, according to the invention, the loading apertures (6, 7) on the vehicle are arranged with individual filling apertures (15, 16) in such a way that they lie fully in the region of a given storage space (3, 4), whereby the filling apertures not allocated to this storage space are connected to the space allocated to this part of the rubbish via intermediate transport channels or supply devices.
