Abstract (en)

[origin: EP0535262A1] In a chair, in particular a rotatable chair, a simultaneous adjustment of the height of the backrest, the height of the armrest and the depth of the seat can be achieved by mounting the backrest on steep lateral bearing arms (18) and, furthermore, to improve the ergonomic features the synchronous mechanism can be put out of action in the furthest forward position of the backrest by a stiff support of the seat (14) which is only released when the backrest is tilted backwards to a relatively great extent. <IMAGE>
