Abstract (en)  
[origin: JPH05192615A] PURPOSE: To minimize the loss of coating material and energy without disturbing the air flow in a spray chamber and to enable coating work with good quality by constituting the above device in such a manner that at least one spray mechanism is supported by first and second disks and is positioned to a material to be coated by the rotational operation of these disks. CONSTITUTION: This device has at least one piece of the spray mechanism 60 which is movable in a theoretical Y axis direction and is movable in a theoretical Z axis direction orthogonal with this Y axis and is provided with a first and second disks 4 and 32 on the same side as the outer side of the moving route of the material to be coated. The first disk 4 is arranged within the plane parallel to the Y axis and is rotatable with respect to a rotary axis 30 extending in the X direction intersecting orthogonally with the Y and Z axes. The second disk 32 is supported by the first disk 4 and is rotatable around a rotary axis 36 which is eccentric in parallel to the rotary axis 30 of the first disk 4. The device is provided with a drive mechanism for turning and rotating of both disks 4 and 32 relative to each other and the spray mechanism 60 is supported by the disks 4 and 32 and is position with respect to the material to be coated by their rotational movement.
